Abstract: It takes two to be accountable: accountability requires actors to exchange information about data stewardship with each other, negotiating policies, demonstrating compliance and remediating failures. This talk will discuss the importance and challenges of interoperability in the creation of an efficient accountability framework for A4Cloud.

This talk will also present A4Cloud's standardization strategy and activities, including ongoing collaborations with ETSI CSC, NIST (cloud service metric) and ISO/IEC (both 17788/17789). Furthermore, during this presentation will be also covered some preliminary insights related with the "jungle of (cloud) accountability" standards that is being analyzed in A4Cloud.
